KTT Matcha		
28	/35	Push Feel
20	/25	Wobble
5	/10	Sound
13	/20	Context
6	/10	Other
72	/100	<b>Total</b>

### Notes

#### Push Feel

Sitting at a nice midground of tactility, the KTT Matchas are fairly quick and subtle with their tactile bump that feels a bit lower located in the push feel than midway. While there is a slight bit of linear pretravel that helps lead into it, the points of collision are the tactile bump, bottoming out, and topping out are all fairly solid with only a tiny bit of scratch in between them.

#### Wobble

Being the first four-pin style top housing that I've seen from KTT, I was pleasantly surprised to find their top housing firmness and slightly noticeable, but not likely with caps on level of stem wobble stayed in these switches.

#### Sound

The sound in these switches is... odd. While they have a push feel of a mid-level tactile switch, they are loud even by high tactility, high spring weight switches. While the tactile bump is a bit louder than normal, the upstroke in the Matchas slaps you right in the face at any typing speed above hunt and peck. That being said, it's not sharp, or even offensive... just loud as all hell.

#### Context

Running as a limited, eastern exclusive groupbuy, these don't win many context points by way of incredible pricing or availability. Relative to KTT, though, the vibrant color, 4 pin top housing, and decent showing from a tactile switch all give this a leg up in my books.

#### Other

Being among the switches I was most excited to receive, they definitely didn't disappoint in confusing me with their sound and providing good notes for KTT. While I don't think these will be talked about years down the road, they certainly are an interesting historical note.
