Notes

Push Feel

With absolutely no pretravel, these snappy yet mid-strength tactile switches definitely deliver a rather unique feel blending high strength and low strength tactile qualities into one switch. Aside the strange 'high' bottoming out point of these switches, these offer an interesting mid-range tactility for those who like snappy tactiles but not necessarily a heavier weight.

Wobble

With not wobble in the top housing at all, this switch has a fairly reasonable amount of stem wobble in both N/S and E/W directions considering TTC's history. Equal in magnitude for both directions, these might be noticeable with keycaps on depending on the profile used.

Sound

The relatively unique 'snapiness' of the tactile bump in these switches also continues into the sound category with a sharp, flat, and mid-high pitched noise that accommodates the bump and increases in pitch at higher speeds. While not exactly the most desirable sound in tactiles, its unique and is supported by otherwise solid bottoming and topping out sounds.

Context

Among TTC's newest attempt at switches, these continue along with their innovative explorations of otherwise untouched areas in switch design. And to top that off, they're doing it at fairly good prices with much more widespread attention than previous releases.

Other

These, along with the TTC Gold Pinks definitely are a step up not only by TTC but by switch companies as a whole in exploring unique gaps in switch offerings. These genuinely do make me excited for what TTC has coming up in the future and make me hope these don't end up underrated and ignored at large.
