Notes

Push Feel

Introduced as being an 'all white H1 clone' these 415Keys' exclusive switches are definitely similar in H1s in that they bring a certain level of JWK smoothness to them. But overall, they definitely are lacking the finest touch with respect to this aspect, as there is still some scratch noticeable and slight ping in some springs. As well, the topping out feels a bit thin and 'poppy'.

Wobble

While still being made with JWK molding, these switches still feature a fairly solid amount of stem wobble in both N/S and E/W directions that will likely be noticeable with caps on and an occasional top housing play that is noticeable in the E/W direction.

Sound

With a nylon bottom, the bottoming out is the only super positive note about the sound of these switches. There is a slight bit of audible scratch and ping to match the push feel notes, as well as an overall higher pitched, thin topping out noise due to the polycarbonate tops.

Context

Low effort in not only their execution, but marketing, these switches only being sold in a bulk, fake "sale" by a single, unresponsive vendor with included films to cover up mistakes shows you that this vendor doesn't even care about the quality of their product.

Other

While I despise people openly referring to all JWK switches as "low effort recolors", this is one of those cases where I can't disagree. This is unfortunately a pinnacle of the JWK bubble and how it has led so many vendors into thinking a simple reissuing of an otherwise okay switch contributes to anyone's betterment in the community.
