Frost Panda		
24	/35	Push Feel
18	/25	Wobble
6	/10	Sound
11	/20	Context
5	/10	Other
64	/100	Total

### Notes

#### Push Feel

Without a doubt, the most prominent feature of these switches is their incredibly pronounced scratch even after factory lubing. While admittedly light in fashion, these are among the scratchiest lubed linears of recent memory. The real saving grace in terms of push feel of these switches is that they have very firm, muted, and solid feeling housing collisions due to the full nylon housing that they feature.

#### Wobble

While there is no top housing wobble, there is a marginal amount of stem wobble with it being just a hair bit stronger in the N/S direction than the E/W direction.

#### Sound

Again, much like with push feel, the scratch of these switches completely degrades from an otherwise solid linear performance. These have no spring ping, and fairly solid and muted housing collisions, in a very par for course fashion for nylon housings.

#### Context

Falling into the 'third wave Panda' category, in which these switches don't actually represent a panda in the slightest, they make fairly reasonable design choices that could stand alone as their own switch. While unreleased and unpriced, yet, I don't understand why they chose to continue to try and profit off of the name and fame of Panda switches.

#### Other

These switches do have some level of promise, aside their name and attempted association, on their own. While I don't know how well these will sell, there will surely be an audience who rather enjoys the long-stemmed, full nylon, and milky housing that these switches offer as its not something that is currently sold by Tecsee.
